This white paper discusses the implementation of ActivCard® smart cards on HP Consolidated Client Infrastructure (CCI). This white paper is not intended as a comprehensive overview of ActivCard smart card technology.

NOTE: The images and instructions in this white paper use Microsoft Windows XPe; however, HP also tested procedures using Microsoft XP Professional and Microsoft Windows CE.NET.

NOTE: The images in this white paper were created using ActivClient™. For information about ActivCard Gold™, see the ActivCard Gold user guide.

Introduction
Smart cards can provide additional security to a CCI implementation. This paper describes a smart card reference implementation that you can use in a dynamic or a static CCI environment.

Prerequisites
This white paper assumes that the reader is familiar with CCI and has a working knowledge of Microsoft Group Policies, Microsoft Certificate Authentication (CA), and setting up smart card readers and middleware.

Reference hardware and software
The following list provides the reference hardware and software used to validate the CCI product with a smart card:

• Load Balancer
  • HP Server running F5 networks BigIIP version 4.6.4.
• Primary Domain Controller
• VPN Tunnel
• Altiris Deployment Server
• Network Switch
  • HP Procurve 2626.
• Blade Enclosure
  • HP e-class blade enclosure.
• Blade PCs
  • HP bc1000 blade PC running Microsoft Windows XP SP2.
  • HP bc1500 blade PC running Microsoft Windows XP SP2.

• Clients
  • HP Compaq t5000 series thin client running Microsoft Windows XPe.
  • HP Compaq t5000 series thin client running Microsoft Windows CE.
  • HP desktop PC running Microsoft Windows XP SP2.

• Smart Card Readers
  • HP standard USB Smart Card Keyboard.
    Driver: HPKBCCID.sys, version 4.28.0.1.
  • USB CAC approved smart card reader (SCM Microsystems SCR331 Reader).
    Driver: SCR33X2K.sys, version 4.27.00.01.
  • Serial CAC approved smart card reader (SCM Microsystems SCR131 Reader).
  • USB Combo Fingerprint & Smart Card reader (SCM Microsystems SPR337).
    Driver: spr337.sys, version 1.16.00.01.

• ActivCard middleware
  • ActivCard ActivClient v5.4.
  • ActivCard Gold v2.2.

### Configuration compatibility

HP has tested the following configurations using ActivCard ActivClient v5.4, ActivCard Gold v2.2 and confirmed that the configurations work in a CCI environment.

<table>
<thead>
<tr>
<th></th>
<th>HP USB Smart Card Keyboard</th>
<th>SCM Microsystems SCR331 USB Reader</th>

</tbody>
</table>
Software configuration

Configure the following items to set up a smart card solution on CCI:

1. Certificate Authentication (CA) service
2. Group policy settings
3. Middleware running on a HP blade PC
4. Smart card client driver

Step 1: Configuring a Certificate Authentication (CA) service

After you install the CA service, perform the following configuration steps:

1. Create an MMC with the following snap-ins:
   - Active Directory Users and Computers
   - Certification Authority
   - Certificate Templates

2. Click **Certificate Templates** and look for the Smartcard Logon certificate in the right pane.

3. Create a duplicate template by right-clicking on the Smartcard Logon certificate template, and then selecting **Duplicate Template**.
4. Type a name for the new template in the **Template display name** box. This example uses CCI Smartcard Logon.
5. Click the Request Handling tab.

6. Select or type 1024 in the **Minimum key size** box.

7. Click the **CSPs** button.

8. Select **Requests can use any CSP available on subject's computer**.

9. Click the Security tab.
10. In the **Permissions for Authenticated Users** box, in the **Allow** column, select **Read** and **Enroll**.

You have now completed creation of the template.
11. Copy the CCI Smartcard Logon certificate template into the Certificate Templates folder under the certificate server.

   a) Expand the Certification Authority object in the MMC you created in step 1.
   b) Expand your CA name.
   c) Right-click on the Certificate Templates folder under the CA server.
   d) Select **New > Certificate Template to Issue**.
12. Select the template, and then click **OK** to import the template.

---

### Step 2: Group policy setting

Apply the following smart card group policy settings to the computer through a user policy setting or through a computer policy setting:

- **Computer Configuration\Windows Settings\Security Settings\Local Policies\Security Options - Interactive Logon**: Require smart card, enable or disable. The default is disabled
- **Computer Configuration\Windows Settings\Security Settings\Local Policies\Security Options - Interactive Logon**: Smart card removal behavior, no action or lock workstation or force logoff. The default is no action.

---
To improve Group Policy management, upgrade to the Group Policy Management Console (GPMC).

Current Group Policy Object Links for ccusers

<table>
<thead>
<tr>
<th>Group Policy Object Links</th>
<th>No Override</th>
<th>Disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>SmartCard login</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Group Policy Objects higher in the list have the highest priority. This list obtained from "ccusers", percent.pedomain0.net.

Group Policy Object Editor

Policy

- Domain controller: Allow server operators to schedule tasks
- Domain controller: LDAP server signing requirements
- Domain controller: Password change... (and more)
- Domain controller: Smart card removal behavior: Lock Workstation
- Interactive login: Enable Smart card removal behavior

Policy Setting

- Not Defined
- Defined

Interactive login: Enable Smart card removal behavior

Options...  New  Add...  Edit  Up  Down  Delete...  Properties
Step 3: HP blade PC middleware configuration

The following provides HP blade PC software configuration:

- For the purposes of this white paper, an HP CCI implementation with the hardware and software components listed in “Reference hardware and software” on page 2 was used.
- Install one of the following ActivCard middleware packages on the HP Blade PCs:
  - ActivCard ActivClient v5.4
  - ActivCard Gold v2.2

Step 4: Client smart card driver configuration

>> Install the appropriate driver from the list below for the device that you will use.

- HP standard USB Smart Card Keyboard
  Driver: HPKBCCID.sys, version 4.28.0.1
- USB CAC approved smart card reader (SCM Microsystems SCR331 Reader)
  Driver: SCR33X2K.sys, version 4.27.00.01
  NOTE: For Microsoft Windows CE.NET, you may need to copy the drivers from the folder where they were installed (\Windows) to the \Hard Disk\Program Files folder so the drivers will be written to flash memory.
- Serial CAC approved smart card reader (SCM Microsystems SCR131 Reader)
  NOTE: For Microsoft Windows CE.NET, you may need to copy the drivers from the folder where they were installed (\Windows) to the \Hard Disk\Program Files folder so the drivers will be written to flash memory.
  USB Combo Fingerprint & Smart Card Reader (SCM Microsystems SPR337)
  Driver: spr337.sys, version 1.16.00.01
Smart card setup

Initialization of the smart card

1. Power on the thin client with the smart card reader installed.
2. Open Device Manager to verify that the drivers for the card reader are installed:
   a) Click Start.
   b) Right-click on My Computer and select Manage.
   c) In the left pane, select Device Manager.
   d) In the right pane, expand Smart card readers.
   e) Select the installed smart card reader.
   f) Under Device status, verify the message “This device is working properly.”
3. To begin the enrollment from the blade PC side, open the Remote Desktop Connection window by clicking Start > All Programs > Accessories > Communications.

4. Select the Local Resources tab.

5. In the Local Devices area, select Smart cards.

6. Connect to the blade PC on which you will set up the smart card and log in as a domain-authenticated user.

7. Verify the ActivCard icon is displayed in the system tray.

8. Insert an unprogrammed ActivCard-compatible smart card into the reader. The ActivCard icon in the system tray changes from red to blue.

9. Select the ActivCard icon in the system tray to open the ActivCard utility.

10. Select Tools > New Card to initialize the smart card.

11. In the New PIN and Verify boxes, type a PIN for the card, and then click OK. The system displays the unlock code for this card in case the PIN is lost.

12. Close the ActivCard utility.
Requesting a certificate from the blade PC

1. Open Internet Explorer and go to the Certification Server enrollment Web site. The address of this Web site was determined when the Certification Server was set up (see “Step 1: Configuring a Certificate Authentication (CA) service” on page 4). If you do not know the Web address, consult your network administrator. In this example, the address used is http://pecert/certsrv.

2. Click the **Request a Certificate** task.

3. On the Request a Certificate page, click **advanced certificate request**.

4. On the Advanced Certificate Request page, select **Create and submit a request to this CA**.

5. On the Advance Certificate Request page:
   a) Select **CCI Smartcard Logon** as the certificate template.
   b) Select **ActivCard Gold Cryptographic Service Provider** as the CSP.
   c) Submit the request, which requests a CCI SmartCard Logon certificate for the selected user.
6. If a warning message displays about a potential scripting violation, press Yes to continue with the certificate request.

7. After the system generates the public and private keys, the page to install the certificate displays. Select **Install this certificate**. This command installs the user’s certificate onto the smart card.

8. If a warning message displays about a potential scripting violation, press Yes to continue with the certificate request.

9. Upon successful completion, the system displays the Certificate installed page. You may close Internet Explorer.
To verify that the CCI SmartCard Logon certificate for the user is installed on the smart card:

1. Click the ActivCard icon in the system tray to open the ActivCard Gold utility.
2. In the right pane, select the My Certificates icon. The system displays the username ID.
3. Select the username ID to view the installed certificate, which shows:
   - who it was issued to
   - who it was issued by
   - valid dates
Usage cases

Usage case 1: User authentication from client device to blade PC using RDP

The following steps provide instructions for performing a functional test of the CCI SmartCard Logon certificate:

1. Log out of the RDP session.
2. Open the Remote Desktop Communications window and initiate a connection to the blade.
3. Make sure a smart card is installed in the reader. The system requests the smart card PIN.
4. Type the PIN that you assigned. The user is logged into the blade.

Usage case 2: Accessing secure Web site

The following steps provide instructions for accessing a secure Web site using an ActivCard through a blade PC. Installing and configuring a secure Web site is beyond the scope of this white paper; therefore, the white paper assumes the secure Web site is already functional and accessible from the blade PC. The white paper also assumes that you can use the certificate installed on the smart card to access this secure Web site.

1. Log in to a blade PC using a smart card, as demonstrated in usage case 1.
2. Use Internet Explorer to connect to a Web site to make sure the system is functioning properly. Connect to a Web page on the same server as the secure Web site.
3. Confirm that the lower right corner of the Internet Explorer window does not display a lock icon.
4. In Internet Explorer, type the address of a secure Web site.
5. If the system displays security alert messages, click OK. The LED on the card reader indicates when the Web site is accessing the smart card to verify whether the certificate is approved for the site.

6. After the secure Web site displays, a lock icon in the lower right corner of Internet Explorer confirms that you are connected to a secure Web site.

Usage case 3: User authentication using VPN through firewall to blade PC

Instructions for installing and configuring a VPN tunnel with a firewall is beyond the scope of this white paper; therefore, the white paper assumes the VPN tunnel and firewall are already installed and functional. The white paper also assumes that you have a broadband Internet connection and that ActivCard middleware is installed on the client.

1. In the Control Panel on the client computer, open Network and Internet Connections.

2. Select the Create a connection to the network at your workplace task.

3. In the New Connection Wizard, select Virtual Private Network connection.

4. In the Company Name box, type the name for the VPN connection (for example, Work), and then click Next.

5. Select Do not dial the initial connection, and then click Next.
6. In the text box, type the host name or IP address of the VPN tunnel, and then click **Next**.
7. Select **Use my smart card**, and then click **Next**.
8. Select **Add a shortcut for this connection to my desktop**, and then click **Finish**.

Depending upon the configuration of the VPN tunnel, you may have to change the configuration of the VPN connection.

To change the configuration of the VPN window:

1. In Control Panel, open **Network and Internet Connections > Network Connections**.
2. Right-click on the **VPN connection** icon and select **Properties**.
You can initiate the VPN connection after setting it up, as follows:

1. Start the VPN connection.

2. In **Smart card PIN**, type the PIN, and then click **OK**.

While establishing the VPN connection, the system displays **Verifying username and password** and **Authenticated**.
After the connection is established, the network connection icon displays in the system tray.

Additional information

For more information about HP Consolidated Client Infrastructure, see http://h71028.www7.hp.com/enterprise/cache/9885-0-0-225-121.html.
