

HP and NVIDIA Quadro CX

The NVIDIA Quadro® CX is the accelerator for Adobe® Creative Suite® 4, enabling creative professionals to create rich, stunning content in a fast, smooth, and more interactive way. Based on the latest generation Quadro FX graphics platform, Quadro CX is specifically designed to offer additional performance features and capabilities. Quadro CX accelerates Adobe After Effects® CS4 visual effects, provides a fluid interactive canvas for Adobe Photoshop® CS4, and provides lightning fast Blu-Ray (H.264) video encoding for Adobe® Premiere Pro®.

The Quadro CX solution can be purchased as a stand-alone solution or pre-configured within an HP workstation. As a stand-alone solution, Quadro CX is available through a wide range of channel partners, ranging from resellers, e-tailers, and system builders. The stand alone solution comes packaged with the Quadro CX accelerator, installation software including graphics drivers and the CUDA-enabled H.264 video encoding plug-in, and a manual.

As an HP workstation solution, a user can purchase directly from HP or through an HP reseller. The HP workstation solution also comes with the CUDA-enabled H.264 video encoding plug-in on a CD, and must be installed to get the full Quadro CX experience. The main differences with the HP workstation solution and the stand alone solution are that the graphics driver is pre-installed and the control panel will reference the Quadro FX 4800, the base platform for Quadro CX. A user can adjust the graphics settings for the Quadro CX experience by adjusting the listed Quadro FX 4800 settings. Aside from these installation differences, the capabilities and experience will be identical to the stand alone solution.
